CYPLAN 255

Urban Informatics and Visualization

HIT RECORD

Lecture 03 – Python at the Command-Line

January 26, 2022

Agenda

- 1. Announcements
- 2. Getting started with GitHub (cont'd)
- 3. Python at the command-line
- 4. For next time
- 5. Questions

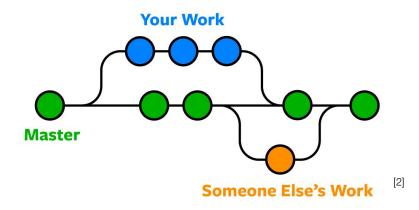

1. Announcements

2. Git + GitHub (cont'd)

https://docs.github.com/en/get-started/getting-started-with-git

Git

- Git is a tool for distributed version control
 - Track changes
 - Log history of changes
 - Merge changes and histories from multiple contributors

GitHub

- GitHub is a website/service for hosting Git-based projects
- Stores a **remote** copy of a project along with commit history
- Tracks branches and forks of the main copy (repository)
- Provides a user interface for communicating with collaborators, tracking bugs, viewing commit history, and executing specific Git operations

Terminology

- repository a folder of files constituting a project
- **remote** (noun/adjective) the copy of your project stored on GitHub
- **clone** (*verb*) copy a remote repository to your local machine
- **commit** (*noun/verb*) a set of changes entered into the tracking system
- **push** (*verb*) upload commits from your local work space to GitHub
- **pull** (*verb*) download commits from remote to local
- **branch** (*noun*) a separate working copy of the files, accumulating changes that will be merged into the main version later on
- fork (noun/verb) a third-party copy of a repository, only loosely connected to the original
- pull request (noun) a request to merge commits from one branch/fork to another

Configuring Git (LIVE DEMO)

- git config --global user.name "Mona Lisa"
- git config --global user.email "mlisa@berkeley.edu"
- git config --list

Typical Git Workflow on local

- 1. Do some work (make local changes)
- 2. Make sure you're on the right **branch**
 - o git branch or git checkout <branch name>
- 3. Tell Git which changes you want to **commit**
 - o git add <filename>
- 4. **Commit** your changes and describe them
 - o git commit -m "this is my first git commit"
- 5. **Push** your local changes to remote
 - o git push

Forking the class GitHub repo (LIVE DEMO)

- Breakout Rooms Part I
 - 1. Open a browser and go to https://github.com/mxndrwgrdnr/CYPLAN255
 - 2. Create your own fork
 - 3. <u>Clone</u> your fork
- 5 MINUTE BREAK: Instructor will create Assignment 0
- Breakout Rooms Part II
 - 1. Sync your fork
 - 2. git pull the changes to you local (cloned) copy
 - 3. git checkout the "assignments" branch
 - 4. Create/copy a new file WITH A UNIQUE NAME and make some changes to it
 - 5. Add, commit, and push your changes (see previous slide)
 - 6. Open a pull request

3. Python at the Command-line

Python vs. IPython vs. Jupyter

- Python an interpreted, high-level programming language
- IPython "interactive" Python interpreter
 - o In [1]: instead of >>>
- Jupyter Notebooks web-based GUI for IPython
 - o .ipynb = "IPython notebook"

Options for Running Python

```
python my script.py
                                     execute a Python script
                                     launch the default Python interpreter
python
    exit()
                                          exit
     <ctrl> + d (Mac/Linux)
                                          exit
     \langle ctrl \rangle + z (Windows)
                                          exit
                                     launch the interactive Python interpreter
ipython
     exit
                                          exit
     <ctrl> + d (Mac/Linux)
                                          exit
     \langle ctrl \rangle + z (Windows)
                                          exit
                                     launch a notebook server and dashboard
jupyter notebook
     <quit> (notebook dashboard)
                                          exit
     \langle ctrl \rangle + c (Mac/Linux)
                                          exit
```

Managing Packages and Virtual Environments

- Anaconda a Python distribution
- Conda a Python package manager and environment manager
 - Created by the Anaconda folks
 - As a package manager
 - Installs Python libraries (packages) from package repositories (e.g. conda-forge)
 - Manages dependencies and resolves conflicts
 - Other examples: "pip"
 - As an environment manager
 - Manages Python virtual environments (sandboxes)
 - Other examples: "virtualenv"

Max's Tips for Creating a Conda Environment

- 1. conda create -n my-first-env
- 2. conda activate my-first-env
- 3. conda config --add channels conda-forge
- 4. conda config --set channel priority strict
- 5. conda install python ipython notebook nb_conda_kernels jupyter_contrib_nbextensions
- 6. jupyter contrib nbextension install --user

Intro to Python (LIVE DEMO)

- SLIDES ⇔ NOTEBOOK
- Options for following along:
 - a. Start a Notebook server (jupyter_notebook) and open the notebook named "lecture_03_intro_python_jupyter.ipynb"
 - b. Open a static copy of the rendered notebook on the class GitHub repo here
 - c. Sit back and enjoy the demo. You can (and should) explore the notebook on your own time afterwards.

4. For next time

For next time ("homework")

- Finish the GitHub exercise which includes:
 - a. Forking the class repo
 - b. Cloning your fork
 - c. Syncing your fork
 - d. Submitting Assignment 0
- Work through lecture_03_intro_python_jupyter.ipynb on your own
- 3. Try creating a conda environment and accessing it from a notebook

5. Questions?

Bonus Material

GitHub Authentication with SSH

- 1. ssh-keygen -t ed25519 -C "your email@example.com"
- 2. "Enter file in which to save the key (/home/jovyan/.ssh/id_ed25519):"
 - o <return>
- 3. "Enter passphrase (empty for no passphrase):"
 - o <return>
- 4. "Enter passphrase again:"
 - o <return>
- 5. Add your ssh key to your GitHub account
 - https://docs.github.com/en/authentication/connecting-to-github-with-ssh/adding-a-new-ssh-key
 -to-your-github-account
